**Quick Reference Sheet**

- **PH** is the balance between **alkalinity** and **acidity**
- **Muriatic Acid** lowers Total alkalinity and PH
- **Baking Soda** raises Total alkalinity only
- **Soda Ash** or **PH Increaser** (granular form) **raises** PH.
- **Liquid metal magnet** is a stain, scale and rust remover. It also helps bind the minerals in the water together. Add 2-4 oz in water every 2 to 3 weeks as a general rule.
- **Chlorine Tabs** or **Granular Shock Treatment** purifies water.
- Regular household bleach can be used to help fight green water (algae). Occasionally apply ½ - 1 gallon in the pool around the water's edge in the evening, with the pump shut off.
- **Do not** use liquid chlorine or liquid algaecide in the pool as it is too harsh over a period of time and could slightly bleach out the color of the shell.

These bullet points are only intended as an aid to remembering some of the points covered during your pool start-up procedure, and are not intended to represent the full maintenance guidelines for your pool.
